Gas chromatography was carried out in a Hewlett Packard 7890 series II Gas Chromatograph using a column of phenyl silicone 5.5% (Zebtron Inferno 30 m x 0.25 mm x 0.25 µm) and Helium as carrier gas. The conditions and method used in the equipment were: 280 °C injector temperature, 250 °C detector temperature. S3. Cooperative Hydrotropy Model

In order to use the cooperative hydrotropy model to fit the experimental data, it was necessary to convert the concentration of hydrotrope in the solute (free-solute basis) to its mole fraction in the ternary system ($x_{Hydrotrope}$), as well as the solubility of the solute to mole fraction in the ternary system (x_{Solute}). It was assumed that the density of the system is equal to that of water. Hence, Equations S1 and S2 were used:

$$x_{Hydrotrope} = \frac{\frac{(1000-S_3)\cdot w_2}{M_2}}{\frac{(1000-S_3)\cdot w_1}{M_1} + \frac{(1000-S_3)\cdot w_2}{M_2} + \frac{S_3}{M_3}} \quad (\text{S1})$$

$$x_{Solute} = \frac{\frac{S_3}{M_3}}{\frac{(1000-S_3)\cdot w_1}{M_1} + \frac{(1000-S_3)\cdot w_2}{M_2} + \frac{S_3}{M_3}} \quad (\text{S2})$$

where w_1 and w_2 are the mass fractions of water and hydrotrope in the solvent (free-solute basis), respectively, M_1 , M_2 and M_3 are the molar masses of water, hydrotrope and solute, respectively, and S_3 is the solubility of the solute in the hydrotropy system (mol/L).

S4. Solute Recovery

The feasibility of adding water to recover dissolved solute from the hydrotropic system was preliminarily studied in this work using the solubility curves fitted with the cooperative hydrotropy model. The concept relies on calculating the mass fraction of solute that is recovered by the addition of a given volume of water. The algorithm used to calculate the recovery curves is as follow. The hydrotropic system, with total mole number n_t^0 , is selected (solute-hydrotrope pair and hydrotrope mole fraction).

1. Select fraction of water to be added (n_{H_2O}/n_t^0).
2. Arbitrate the fraction of solute that precipitates (n_p/n_t^0).
3. Calculate increase of the new system (n_t/n_t^0):

$$\frac{n_t}{n_t^0} = 1 + \frac{n_{H_2O}}{n_t^0} - \frac{n_p}{n_t^0}$$

4. Calculate hypothetical composition of the new system (x_1, x_2, x_3) from the composition of the original system (x_1^0, x_2^0, x_3^0):

$$x_1 = \frac{x_1^0 + n_{H_2O}/n_t^0}{n_t/n_t^0}$$

$$x_2 = \frac{x_2^0}{n_t/n_t^0}$$

$$x_3 = \frac{x_3^0 - n_p/n_t^0}{n_t/n_t^0}$$

5. Calculate saturation mole fraction of solute (x_3') for the hypothetical mole fraction of hydrotrope obtained in step 3 (Equation 3 of the main text with the parameters of Table SX).

6. If $x_3 = x_3'$, stop iteration. If $x_3 > x_3'$, return to step 1 and arbitrate higher n_p . If $x_3 < x_3'$, return to step 1 and arbitrate lower n_p .
